HIWIN Crossed Roller Bearings (CRB Series)

Introduction

HIWIN Crossed Roller Bearings consist mainly of an outer ring, an inner ring and a plurality of rollers and spacers. The rollers lie between the inner ring and the outer ring. The spacer is placed between rollers to prevent the mutual friction so as to decrease the torque resistance for rotation. In addition, the surface of the roller and the rolling track is linear contact. So, when the bearing is loaded, the loading area will be very large. Thus, the elastic deformation will be less, and the bearing will achieve longer service life. Each roller in a Crossed Roller Bearing is crossed at a 90° angle, which is able to handle the loading force from multiple directions at the same time.

HIWIN offers the following six types of Crossed Roller Bearings defined by the following as the split outer ring type (CRBA), the split inner ring type (CRBB), the high rigidity type (CRBC), the split outer ring with mounting holes (CRBD), the high rigidity with mounting holes (CRBE) and the customized type (CRBX). The split outer ring type is suitable for rotating the inner ring. The split inner ring type is suitable for rotating the outer ring. The high rigidity type is suitable for rotating both the inner ring and outer ring. The mounting holes could be used to aid in the assembly. The customized type could be modified to meet the customer requirements. Crossed Roller Bearings possess high rigidity and high rotational accuracy, which could be widely used in industrial automation control, robotics, machine tools, inspection and medical devices.

Product Features

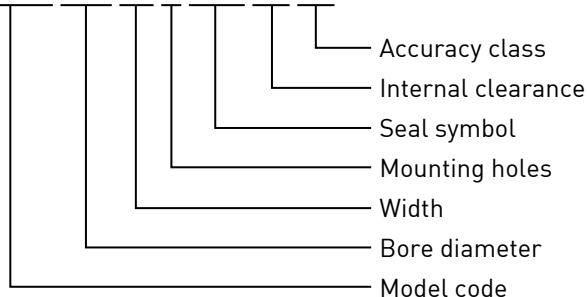

1. Patented design features high loading capacity
2. High rigidity
3. Dimensional and rotational accuracy tolerance range is tighter than international standards
4. Accepts loads from all directions at the same time
5. Smooth rotation
6. Compact, space saving
7. Easy installation and adjustment
8. Various bearing types and sizes to accommodate your requirements
9. Customized designs available

Specification

1. Model Code: of bearings. CRB stands for Crossed Roller Bearing. Six types of CRB, which are defined by the following:
 A: split outer ring.
 B: split inner ring.
 C: high rigidity.
 D: split outer ring with mounting holes.
 E: high rigidity with mounting holes.
 X: customized.
2. Bore Diameter: (unit: mm). For example, 080 represents the bore diameter of 80 mm, and 100 represents the bore diameter 100 mm.
3. Width: (unit: mm).
4. Mounting Holes: If left blank, it represents a bearing without mounting holes.
 A represents the bearing with mounting screw holes,
 B represents the bearing with same direction counter-bored holes, and
 C represents the bearing with opposite direction counter-bored holes.
5. Seal Symbol: WW signifies seals on both sides. NN signifies the open type without seals. Both types have oil holes for lubrication.
6. Axial internal clearance: C1 signifies positive clearance with less friction force, while C8 signifies negative clearance without backlash, which will result in an increase of friction force during unloading conditions.
7. Accuracy class: General Class 5 (P5), Class 4 (P4), Class 2 (P2), Class D5 (PD5), Class D4 (PD4) and Class D2 (PD2). Please see Tables 1~7 for standard accuracy grades.

CRBD 080 22 A WW C8 P5

Types of Crossed Roller Bearings

1. Split outer ring type (CRBA)

Consists of an inner ring and two outer semi-rings, which is suitable for inner ring rotation.

2. Split inner ring type (CRBB)

Consists of two inner semi-rings and an outer ring, which is suitable for outer ring rotation.

3. High rigidity type (CRBC)

Consists of an inner ring and an outer ring, which is suitable for both inner and outer ring rotation.

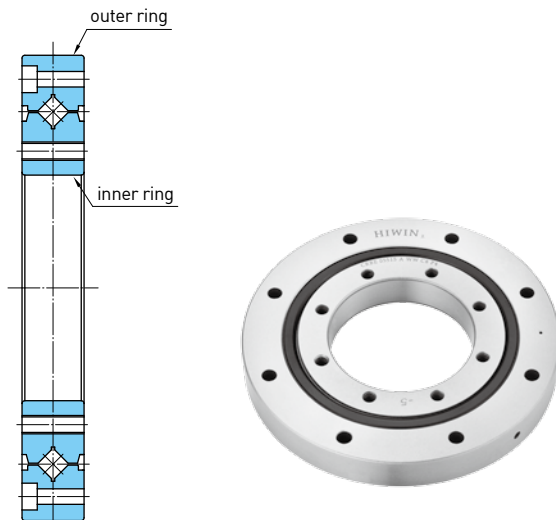

4. Split outer ring with mounting holes (CRBD)

Consists of an inner ring and two outer semi-rings with mounting holes. The mounting holes, enable the bearing to be fixed and it is suitable for inner ring rotation .

5. High rigidity with mounting holes (CRBE)

Consists of an inner ring and an outer ring with mounting holes. The mounting holes, enable the bearing to be fixed and it is suitable for both inner and outer ring rotation .

6. Customized type (CRBX)

The bearing could be designed and modified in accordance with the customers requirements to achieve a more innovative structure. The surface treatment could also be customized to meet the customers' environmental requirements.

Structure of sealed type and open type

- 1. Sealed type:** The seal will prevent any foreign substance from entering the track as well as preventing lubrication leakage. The sealed type has oil holes for lubrication.
- 2. Open type:** Non-seal structure makes the friction smaller, and it is suitable for low torque application. The open type also equips with oil holes for lubrication.

Accuracy

Table 1 Bore diameter accuracy

Unit : μm

Nominal bore diameters, d (mm)		Bore diameter deviations, Δd_{mp}					
		P5, P4, P2		PD5		PD4, PD2	
over	include	high	low	high	low	high	low
18	30	-1	-9	-1	-6	-1	-5

Selecting a Crossed Roller Bearing

The general selection for a Crossed Roller Bearing is shown below:

Dynamic Equivalent Load, P

When the acting load is radial load, axial load and torque, all loads can be combined to a single load acting on the center of bearing. It is called the dynamic equivalent load, and is represented by equation (1):

$$P = X \left(F_r + \frac{2M}{D_{pw}} \right) + Y F_a \dots\dots\dots (1)$$

where, $X = 1, Y = 0.45$ for $\frac{F_a}{F_r + 2M/D_{pw}} \leq 1.5$

$X = 0.67, Y = 0.67$ for $\frac{F_a}{F_r + 2M/D_{pw}} > 1.5$

In equation (1), P is the dynamic equivalent load; F_r is the radial load; F_a is the axial load; the unit of P, F_r and F_a is Newton (N) or kilogram force (kgf); M is the torque in N · mm or kgf · mm; X and Y are the radial and axial load coefficients; the pitch circle diameter, $D_{pw} = (\text{inside diameter of bearing, } d + \text{outside diameter of bearing, } D)/2$, and the unit is mm.

Basic Life Rating, L

The basic life rating means 90% of bearings will not fail after operating for a certain revolution under the same operating condition. Equation (2) can be used to calculate the basic life rating under a constant load and a constant revolution:

$$L = \left(\frac{C}{P} \right)^{\frac{10}{3}} \dots\dots\dots (2)$$

In equation (2), L is the basic life rating of the bearing in 10^6 revolutions; P is the dynamic equivalent load; C is the basic dynamic load rating; and the unit of P and C should be the same in either Newton (N) or kilogram force (kgf).

Static Equivalent Load, P_0

When the bearing experiences a radial load, axial load and torque, the permanent deformation will take place at the contact location of the roller and the track. This load is referred to as the static equivalent load, which can be calculated using equation (3):

$$P_0 = F_r + \frac{2M}{D_{pw}} + 0.44 F_a \quad \dots\dots\dots (3)$$

In equation (3), P_0 is the static equivalent load; F_r is the radial load; F_a is the axial load; the unit of P_0 , F_r and F_a should be the same in either N or kgf; M is the torque in N · mm or kgf · mm, the force unit should be the same as P_0 , F_r and F_a ; the pitch circle diameter, $D_{pw} = (\text{inside diameter of bearing, } d + \text{outside diameter of bearing, } D)/2$, and the unit is mm.

Safety Factor, f_s

The safety factor (f_s) is determined by the basic static load rating (C_0) and the static equivalent load (P_0), as shown in equation (4). The suggested safety factor based on the bearings operation condition is shown in Table 9:

$$f_s = \left(\frac{C_0}{P_0} \right) \quad \dots\dots\dots (4)$$

Where C_0 and P_0 are the basic static load rating and the static equivalent load, and the unit should be the same in either N or kgf.

Table 9 Operation condition and the suggested safety factor

Operation condition	Safety factor (f_s)
Standard operation	≥ 1.5
Bearing with vibrating load	≥ 2
High rotation and high accuracy	≥ 3

Example calculation of the basic life rating and the safety factor

Bearing: CRBA 15025 WW

Inside diameter $d = 150$ mm	$W_1 = 800$ N
Outside diameter $D = 210$ mm	$W_2 = 2200$ N
Pitch circle diameter, $D_{pw} = 180$ mm	
Basic dynamic load rating $C = 73100$ N	$F_r = 3000$ N
Basic static load rating $C_0 = 131900$ N	$L = 800$ mm

Calculation:

Radial load: $F_r = 3000$ N

Axial load: $F_a = W_1 + W_2 = 800 + 2200 = 3000$ N

Torque: $M = W_1 \times L = 800 \times 800 = 640000$ N · mm

Pitch circle diameter: $D_{pw} = (d + D)/2 = (150 + 210)/2 = 180$ mm

$$\frac{F_a}{F_r + 2M/D_{pw}} = \frac{3000}{3000 + 2 \times 640000 / 180} \cong 0.297 < 1.5$$

Radial load coefficient, $X = 1$, axial load coefficient, $Y = 0.45$

Dynamic equivalent load:

$$P = X \left(F_r + \frac{2M}{D_{pw}} \right) + Y F_a = 1 \times \left(3000 + \frac{2 \times 640000}{180} \right) + 0.45 \times 3000 \cong 11461$$
 N

Static equivalent load:

$$P_0 = F_r + \frac{2M}{D_{pw}} + 0.44 F_a = 3000 + \frac{2 \times 640000}{180} + 0.44 \times 3000 \cong 11431$$
 N

Basic life rating: $L = \left(\frac{C}{P} \right)^{\frac{10}{3}} = \left(\frac{73100}{11461} \right)^{\frac{10}{3}} \cong 481(x10^6 \text{ rev.})$

Safety factor: $f_s = \left(\frac{C_0}{P_0} \right) = \frac{131900}{11431} \cong 11.5$

Notes: 1. If the axial load (F_a), the radial load (F_r) and the torque (M) are applied on the bearing, no direction should be considered for these three loads because they are all positive values.

2. 1 N = 0.102 kgf = 0.2248 lbs; 1 mm = 0.03937 inch.

Recommended fit

Table 10 Suggested tolerance of shaft and bearing housing

Clearance type	Load condition		Suggested fit	
			Shaft	Bearing housing
C8	Rotation load of inner ring	Common load	h5 (0~5 μm of interference fit)	H6 (0~10 μm of interference fit)
		High vibrating load		
	Rotation load of outer ring	Common load	g5 (0~10 μm of interference fit)	JS6 or J6 (0~5 μm of interference fit)
		High vibrating load		
C1	Rotation load of inner ring	Common load	js5 or j5	H6
		High vibrating load	k5	JS6 or J6
	Rotation load of outer ring	Common load	g5	JS6 or J6
		High vibrating load	h5	K6

Note: 1. When the bearing has a higher preload, the fitting way in parentheses should be used.

Example 1:

The axial clearance class is C8, the inner ring is rotated (outer ring is not rotated), the split outer ring type (CRBA) is suggested.

Example 2:

The axial clearance class is C8, the outer ring is rotated (inner ring is not rotated), the split outer ring type (CRBB) is suggested.

How to fix the bearing and the design of the bracket and mounting disc

The bracket and the mounting disc are parts for supporting and clamping the bearing. The Crossed Roller Bearing has a thin wall, so it is necessary to consider the rigidity of both the bracket and the mounting disc. When the split type of bearing is used, and the rigidity of both the bracket and the mounting disc is insufficient, the bearing will be deformed due to uneven pressure of the inner ring and outer ring, resulting in reduced performance and stability. In order to prevent this occurrence, the bracket and mounting disc should be designed as follows:

Housing: The wall thickness of the bracket, T , can be calculated by equation (5):

$$T > \frac{D-d}{2} \times 0.6 \dots\dots\dots (5)$$

In equation (5), D is the outside diameter of the outer ring; d is the inside diameter of the inner ring. Steel is the material used for the bracket in this equation. If aluminum or aluminum alloy is used, it should be adjusted in accordance with the property of that material.

In addition, screw holes can be added into the bracket. So, when the bearing needs to be removed, the bolts can be used to eject the bearing from the bracket without damaging the bearing. As for the dimension of the Mounting disc(Da, da), please refer to the relevant dimension shown in the bearing specification.

Mounting disc: The wall thickness (E) and the clearance (S) of the mounting disc can be calculated by equation (6).

$$E = B \times 0.5 \sim B \times 1.2$$

$$H = B \begin{matrix} +0 \\ -0.1 \end{matrix} \dots\dots\dots (6)$$

$$S = 0.5\text{mm}$$

Refer to Table 11 for the number of bolts used for the outer ring mounting disc. If the inner ring mounting disc is used, the inside diameter of the bearings inner ring can be substituted into Table 11 for calculating the number of bolts. If medium hard steel is used for the bracket or the mounting disc, the torque value shown in Table 12 can be used for tightening the bolts. Additionally, the dimensional tolerance of the parts should be considered while installing the mounting disc in order to make the mounting disc and the inner and outer ring combined closely.

For high accuracy demand, mounting disc are designed with a section difference which can be used to adjust the tightening force by grinding the section surface.

Mounting disc made of steel are suggested to design with a 0.02~0.05mm section difference, furthermore, mounting disc with larger axle diameter or load should have larger section difference to provide sufficient lock rigidity.

Table 11 Bolt number and bolt dimension

O. D. of outer ring, D (mm)	Bolt number	Bolt specification
100 below	8 (Included) more	M3~M5
100~200	12 (Included) more	M4~M8

Installation steps

1. Inspect the parts before installing: Clean bearing bracket, main axle or other parts to remove dirt or grease.
2. Place the bearing into the bearing bracket and main axle: To match the design clearance, keep the bearing horizontal and insert the bearing into the bearing bracket or axle. If it is hard to install, use a rubber hammer to slightly hit evenly around the peripheral of the bearing in axial direction. So that the bearing can be inserted into the bearing bracket or axle easily. Pay close attention to the hitting force as the bearing could be damaged if the force is too large. Afterwards, the matching status of

bearing and datum alignment can be examined by checking if there is noise detected due to misalignment. For an interference fit, use heating or cooling to expand or shrink the parts for ease of installation. Be sure the bearing temperature does not exceed 80°C . If the split inner or outer ring is acentric, please loosen the bolts slightly and rotate the monolithic ring to adjust the concentricity of split ring, so that the bearing can be fit in the bracket.

3. Install the mounting disc: Place the mounting disc onto the bearing and align the screw holes. Screw all the bolts in the holes first and follow the order as shown in above diagram when tightening bolts in diagonally opposite sequence. Do not tighten bolts at once.

Other Information

Lubrication

1. There is #2 Lithium/Calcium soap grease lubricant in all Crossed Roller Bearings. Delivered bearings can be used immediately as directed. If there is insufficient lubrication, the frictional resistance will increase and the service life will be reduced. The lubricant should be supplemented for the open bearing periodically, approximately every 1 ~ 6 months. The lubricating frequency depends on the application condition. The lubricant should be distributed evenly inside the bearing.
2. Avoid cross-mixing lubricants.
3. If the bearing is used in high vibration, clean room, vacuum, high or low temperature applications, a specific lubricant should be used, please contact HIWIN.

Allowable RPM

The allowable DN value of the Crossed Roller Bearing is 60000 mm•rpm. If the CRBB 05013 WW C8 P5 bearing is used, it has a roller PCD of 65 mm. So, the allowable rpm is about $60000/65 = 923$ rpm.

Cautions

1. The normal operating temperature of the bearing is 10 ~ 80 °C . If it is over this temperature range, please contact HIWIN.
2. If a foreign substance enters inside the bearing structure, the rotation route of the roller may be damaged, or the bearing may fail.
3. If a foreign substance enters inside the bearing structure, please clean it then refill the lubricant.
4. Please do not remove or apply force to the bolt and nut of the split bearing.

Product Specification

- Split outer ring type (CRBA), the bore diameter is 20 ~ 400 mm, sealed and open type.
